Day 19. Back Propagation

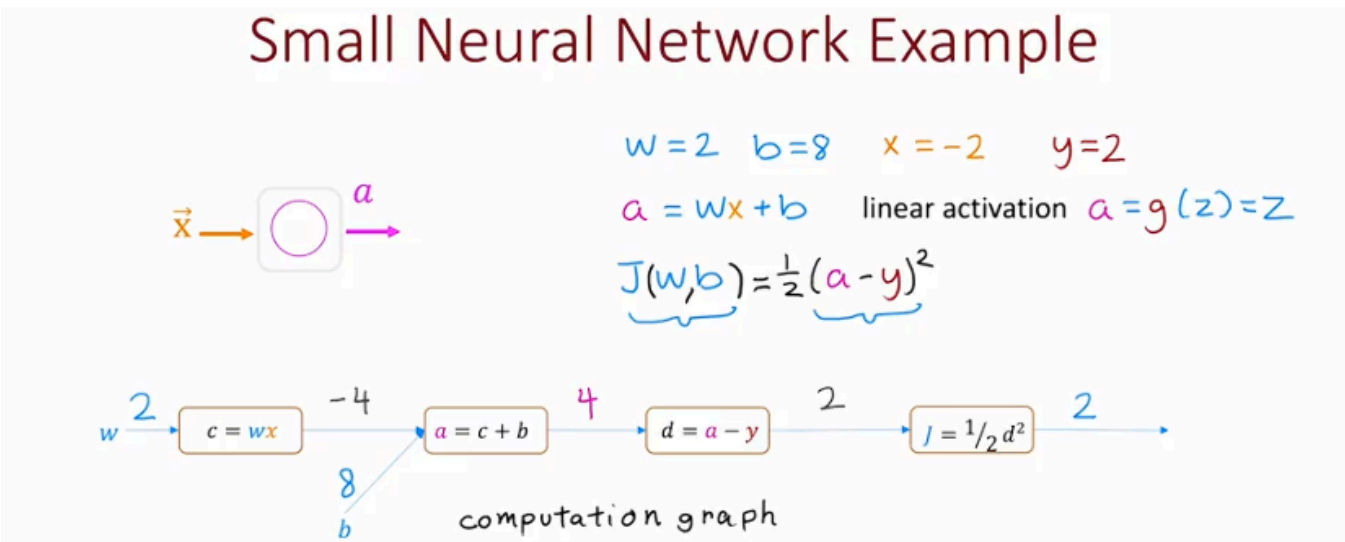
Backward propagation

What is a derivative

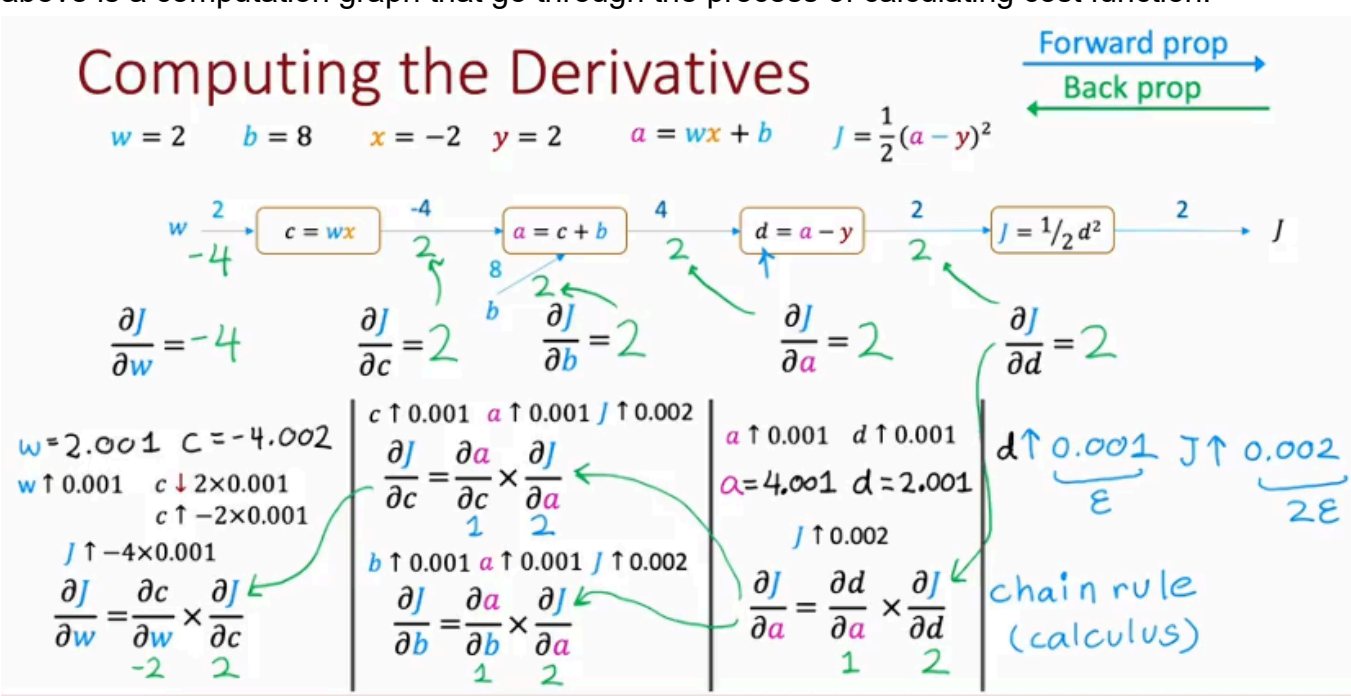
> since these things are already covered in mathamatic analysis, we will not cover this part in our note again this time.

Computation graph

the computation graph is a key idea in deep learning, and it is also how programming frameworks like TensorFlow, automatic compute derivatives of your neural networks.



above is a computation graph that go through the process of calculating cost function.



so basically backward propagation is the computation process of how we find out the derivatives with the chain rule step by step.
