Day 7. Feature engineering and further machine learning

Z-score normalization

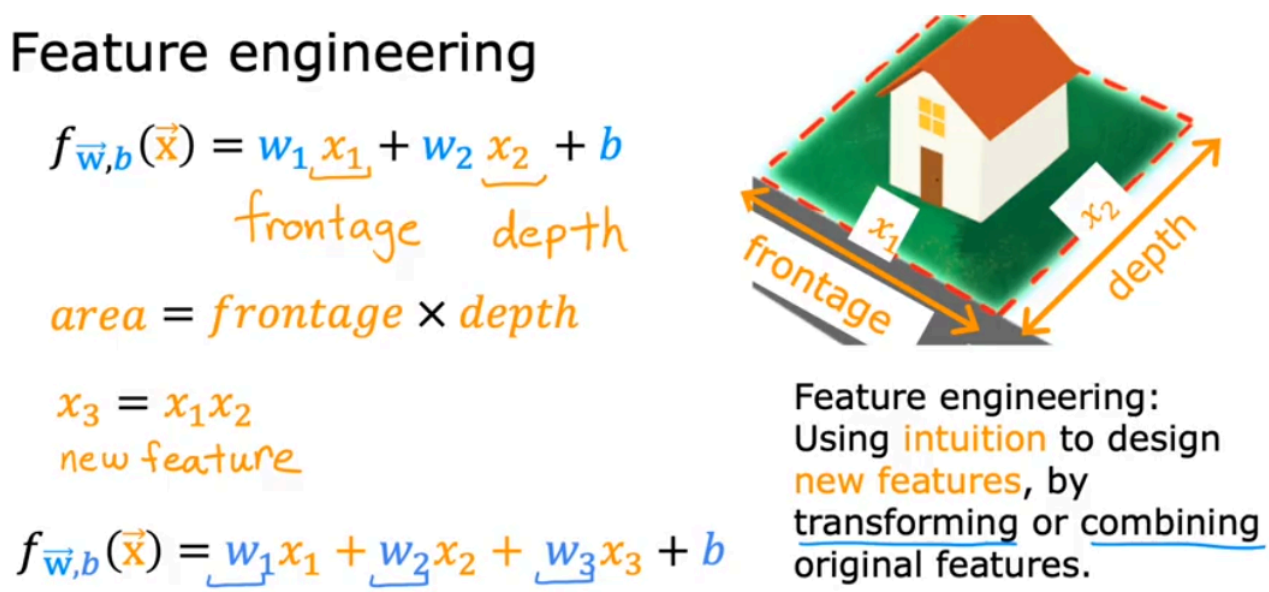
$$x_j^{(i)} = \frac{x_j^{(i)} - \mu_j}{\sigma_j}$$

where

$$\mu_j = \frac{1}{m}\sum_{i=0}^{m-1} x_j^{(i)}$$

$$\sigma_j^2 = \frac{1}{m}\sum_{i=0}^{m-1} (x_j^{(i)} - \mu_j)^2$$

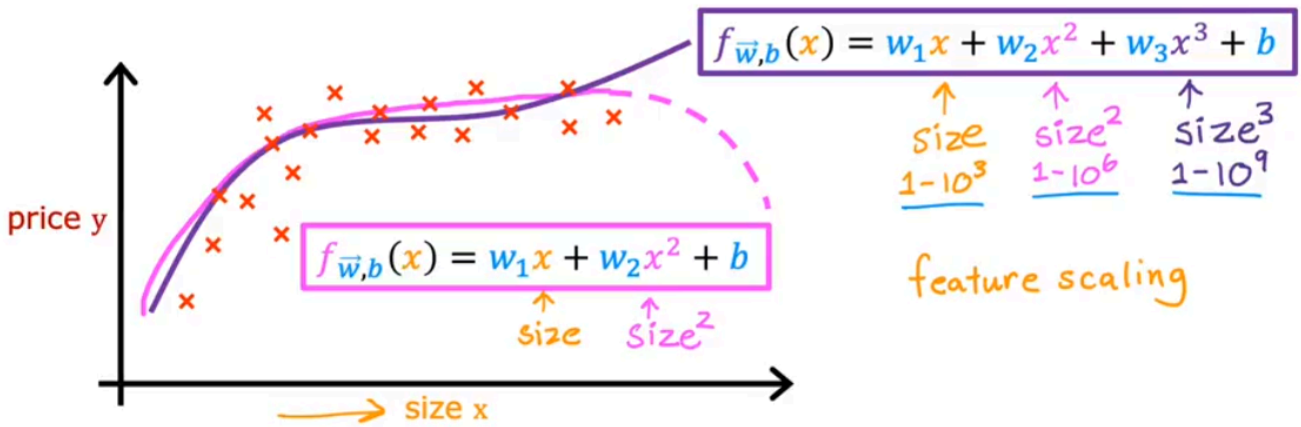
Feature engineering

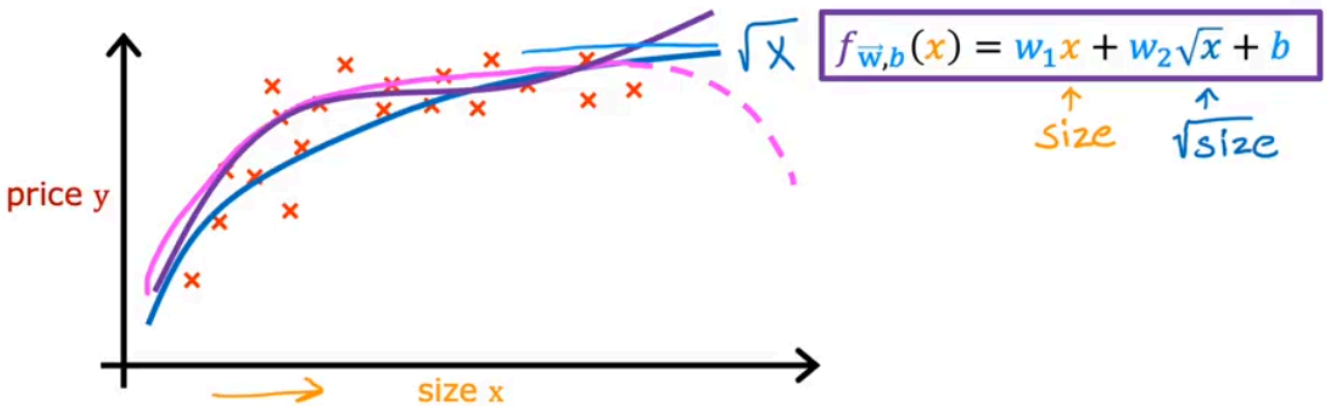


Polynomial regression

we have already learnt to fit lines, now let's try a new algorithm to let us fit curve.

Polynomial regression





Choice of features
